

NORTHSTAR ENDOCRINE CONSORTIUM
TYPE 2 DIABETES MELLITUS CLINICAL PRACTICE GUIDELINE
Version 2.0
Effective date: 2024-03-01
Publisher: Northstar Endocrine Consortium (synthetic)
Authority: Official Clinical Guideline (Tier 2)
Supersedes: Version 1.0 (2022)

PURPOSE

This synthetic guideline addresses pharmacologic therapy for adults with type 2 diabetes mellitus.

Version 2.0 supersedes Version 1.0. Where recommendations conflict, Version 2.0 is authoritative.

CLINICAL MANAGEMENT RECOMMENDATIONS

First-line pharmacologic therapy for adults with type 2 diabetes is metformin unless contraindicated. If metformin is contraindicated or not tolerated, clinicians should use an alternative agent supported by this guideline rather than reverting to superseded Version 1.0 sulfonylurea-first language. Lifestyle counseling should accompany pharmacologic therapy. This guideline does not authorize autonomous diagnosis or autonomous prescribing.

MONITORING

Reassess glycemic control after metformin initiation according to this guideline.

Monitor renal function when metformin is used.

LIMITATIONS

This document is synthetic evaluation content. It contains no real patient data and is not medical advice.
